Vinyltec 2015 will be held October 13-15, 2015 in Akron Ohio and will be co-sponsored by the Akron Section of the Society of Plastics Engineers. The Technical Program Committee led by Kasper Van Veen has assembled an exciting theme for this conference, “Enabling Technologies for the Future in the PVC Industry”. The technical program is comprised of topics related to rigid and flexible vinyl. The conference will focus on:

- Opportunities & Challenges of PVC Recycling
- Market Applications of Vinyl
- Equipment Interaction
- International Applications & Markets
- The Impact of Environmental Considerations
- Economic Impacts on the Vinyl Industry

The conference will be preceded by a one day conference on “PVC Compounding Technology and Materials”. During this conference, information will be presented on the fundamental aspects of PVC compounding that includes fundamentals of PVC formulating, additives for flexible PVC, plasticizer selection and interaction, equipment interaction, and many more topics.

I would encourage you to register for this exciting event. It is an opportunity to learn about new technologies and markets for vinyl products and it is also a great opportunity to network with people in the industry. I hope to see you at Vinyltec 2015 in October!

Maryellen
President, SPE Vinyl Plastics Division
On July 9th we lost a friend. Dave served in World War II as a Naval Deck Officer, then earned a PhD in Chemistry at Ohio State. He had been a research chemist for Goodyear, DuPont, Union Carbide, General Cable and Tenneco before founding Extrusion Engineers, which specialized in melt rheology, friction analysis and process equipment. He published frequently on topics ranging from extrusion, analytical methods, friction properties of thermoplastics, rheology of vinyl compounds, elongation flow behavior of melts to shear effects on molecular structure of polymers. This work led to very substantial cost reduction in extrusion, particularly in wire and cable manufacture, as well as to ASTM methods D3364 Melt Flow Analysis, D3591 Analysis of Formulated PVC, D5576 Structural Entities in Polyolefins and D5477 Polymer Layers or Inclusions by FTIR. A condensation of one of his later papers follows.

In addition to being a Fellow of the Society, Dave was recognized similarly by the American Institute of Chemists, American Association for the Advancement of Science, American Society for Testing and Materials, and the Institute of Electrical and Electronic Engineers.

What we will remember most is the help given unsparingly to younger colleagues and the shining smile. Let us smile once more for Dave.
SHEAR DEFECTS ON THE MOLECULAR STRUCTURES OF PVC AND OTHER POLYMERS NEAR NANOMETRIC SIZES

David W. Riley
Extrusion Engineers
Princeton, New Jersey

Introduction
The rheology of polymer flow is inherently and sensitively related to the molecular structure. The science would be simple if the polymers were stable—all we would have to do is relate the molecular weight, molecular weight distribution, and the melting characteristics directly to the flow and we would have most of our answers. Shearing effects have long been an unrecognized hindrance to proper processing. With the major work in the last fifty years being in the area of heat stabilization, shear changes have now become the major detriment to consistent properties in most polymers.

However, most polymers are not shear-stable and are changed, depending on the type of structure and the amount and intensity of shear during flow. The range of shear rates studied and addressed is over ten billion reciprocal seconds. The results of this study lead one to the conclusion that most of the problems in processing are due to a complete lack of understanding of these alterations in the structure (assuming consistent compounding). These alterations range from macromolecules through nanostructures to small, even volatile polymers. These structural differences will be discussed in detail, emphasizing the importance of nanometric sizes.

As if the effect of shear were not enough to alter the structure, the presence of oxygen dissolved in the polymer adds to the complexity; these additional reactions can cause complex branching and even incipient crosslinking. The end result can be unprocessable gel formation.

Almost every polymer is different in its capacity to change with shear. Poly(vinyl chloride) is one of the more sensitive, followed by polypropylene and polybutylene. The relative sensitivity of a wide range of polymers will be discussed.

Also the usefulness of various rheometers in detecting many of these changes will be discussed. The structural changes and rheological effects in the polymers will also be interpreted by molecular-structural functions observed using infrared spectroscopy and size exclusion chromatography, as well as other analytical functions.

Experimental
Processing Example: Instability Studies using Extruders. In Figure 1, the instability of melt flow is given as a function of RPM of an 1112 mm (4 ½”) extruder vs. Melt Flow Rate. Three lots of flexible PVC were run through the extruder at normal processing temperatures (170°C) at different screw speeds. The material was sampled coming out of the crosshead for two cases. A third set of samples was taken directly off the tip of the screw. The differences demonstrate what happens for both the effect of the crosshead and the screw alone. The barrel settings ranged from 150 to 160°C, trying to take differences demonstrate what happens for both the effect of the crosshead vs. the screw alone. The barrel settings ranged from 150 to 160°C, trying to take differences demonstrate what happens for both the effect of the crosshead vs. the screw alone.

Results & Discussion
The ranking of shear instability for many polymers has been evaluated, and we conclude that apparent shear stability ranks in the following order:

Most shear stable
- Low density Polyethylene
  - Linear low density PE
  - High densityPE
- Polybutylene

Almost the least stable
- Polypropylene (mostly decreasing mol. wt.)

Least stable
- Poly(vinyl chloride)

The shear effects proceed through a mechanism of fragmentation to a series of re-alignments into a progressively more complex series of structures in PVC. These complex structures are defined as incipient crosslinking. This complex polymeric system has been observed widely in the processing world. However, the results are greatly modified depending on the level of sensitivity to alteration by mechano-chemical chain reactions.

At the time that this newsletter will publish the Vinyl Division will be getting ready for the 2015 Vinyltec in mid-October in Ohio and the Council will be meeting in Pittsburg just before the Vinyltec in Pittsburg. The Vinyltec this year will be in Ohio and the program is fully packed with great presentations. I would certainly encourage you to attend. It will be near Akron Ohio.

As this is prior to the Council meeting there really is not much to report on at this time. However I have been asked to join the Operational Planning Committee. This group is somewhat free ranging (but not like the chickens you can buy). Actually it is a group focusing on planning change (at least partially) is the best way I can explain. Dr. Brian Grady is the current chair of this group.

One of the team’s members is on the Next Generation Advisory Board. Of course one of our tasks is to set a recognition program for younger professions. There are two awards that are being considered. One is an award similar to the Honored Service Member award and the other is similar to the Fellow award. It is not to say that someone 35 years old or younger could not be awarded either of the standing awards (HSM or Fellow) mentioned above could not be awarded to a young profession in the plastics industry but as we all know this would not be the norm in the SPE. So to recognize a younger member the concept a different criterion from current requirements for these types of awards would be set. One for the Service award and the Technical award would be another. The committee is in the process of designing these awards at this time. This is not to diminish the current HSM or Fellow (the author is both) but to actually enhance them. And of course allow a young member to understand the value for their self and for the place of employment.

All of us in the SPE should consider mentoring to get others to understand the value of SPE. I really know it was important in the development of my career and we would like to pass it on just as others have helped us.

I have not seen an agenda for the Council meeting yet. So it really is not wise to speculate. But as always I welcome comments and questions about Council. I am your voice in the SPE governance. Please use it.

Best Regards,

Bill Arendt

How would you know if plastics would one day have a place in our green way of life?

Keep tomorrow in mind in all that we do today.

With continuous innovation for over 50 years, we created LOXIOL®, today’s most sought after natural-based plastic additive. This paved the way for more application of plastics in various industries, making us one of the world’s leading natural-based chemicals producers. With a 170-year-old heritage, global distribution network and commitment to research and technology, we can help formulators meet market demands for sustainable and high performance solutions while working towards a greener future for plastics too.
